

## Questionnaire for designing a Sapflow-Measurement System:

- 1) At what kind of tree/plant you intend to measure?
- 2) What is the diameter of the tree/plant?
- 3) Are you planning to measure with more than one sensor/plant (recommended for diameters >125mm)
- 4) What is the distance between the sapflow-sensor and the data-collection system?
- 5) How many trees/plants are to be measured?
- 6) Are you planning to measure PAR as well (sapflow correlates pretty good with PAR, so measuring PAR is a good way of checking sapflow-measurement results!)
- 7) Are you interested as well in a datalogging-system?
- 8) How many channels/logger?
- 9) Are you interested as well in a suggestion for the power-supply?
